

San Joaquin River Restoration Program

Fisheries Management Work Group
Technical Feedback Meeting

CSU-Stanislaus
October 7, 2008

Agenda

- Introductions
- Fish Management Plan Progress
 - Purpose and Scope
 - Limiting Factors Definitions
 - Restoration Strategy and Routing Examples
- Next Steps and Future Meetings

Introductions

- Name
- Agency or Affiliation
- Why the San Joaquin River is important to you and/or your agency.

Purpose

- Fisheries Management Plan
 - Revisit the purpose, scope, and progress to date
- Revised Limiting Factors Approach
 - Review the approach to defining
 - Get your feedback on whether or not the approach follows a logical process
- Updated Restoration Strategy and Decision Tree
 - Get your input on:
 - Transparency of the strategy
 - Do the updates address the feedback provided at the September meeting

FMP is a Programmatic Roadmap for Fisheries Restoration & Management

- Roadmap to adaptively manage restoration and maintenance of naturally reproducing and self-sustaining populations
- Addresses salmon and other fish (including steelhead)
- Geographic scope emphasis is the San Joaquin River to the confluence of the Merced River
- Programmatic strategy for implementation of the Settlement from a fisheries perspective
 - Outlines how a fisheries implementation plan would be developed

Sections of the FMP

- Chapter 1: Introduction
 - Purpose
 - Planning criteria, planning process, and plan assumptions
 - External review
- Chapter 2: Restoration Goals
 - Definition of fish in good condition
 - Spring-run goals
 - Fall-run goals
 - Other fish goals
- Chapter 3: Reintroduction Strategy
 - Genetics management
 - Stock selection
- Chapter 4: Restoration Strategy and Objectives
 - Restoration strategy
 - Objectives
 - Reach-by-reach evaluation and action routing
- References
- Restoration Flows Appendix
 - Interim Flows
 - Restoration Flows

FMP = Fisheries Management Plan

Program Documents Related to or Driving the FMP

Input from the Feedback Group is an Important Aspect of the FMP

Prior Documents and Meeting Materials Available on the Website

Technical Memoranda (14)

Date	Title/Description
26-Sep-2008	SNRP Monitoring Plan for Physical Parameters, Sept. 13, 2008
20-Jun-2008	Temperature Model Selection Draft III
20-Jun-2008	Temperature Model Sensitivity Analyses Set 3 Draft III
03-Jun-2008	Schedule of Documents and Anticipated Release Date
03-Jun-2008	Quantitative Fisheries Model Selection Recommendation Process
08-Apr-2008	Operative Guidelines for Implementing Restoration Plan III
01-Apr-2008	Alternatives Formulation Strategy
08-Feb-2008	Temperature Model Sensitivity Analyses Sets 1, B, 2
08-Feb-2008	Temperature Model Sensitivity Analyses Sets 1, B, 2 Appendix A - Set 1 Existing Conditions with Flow Scen
08-Feb-2008	Temperature Model Sensitivity Analyses Sets 1, B, 2 Appendix B - Set 2 Releases Without Reservoir Operat
08-Feb-2008	Draft Background Report on Freat Dam Operations
07-Feb-2008	Conceptual Models of Storage and Limiting Factors for San Joaquin River Chinook Salmon
17-Dec-2007	Procedures for the Measurement, Identification, and Monitoring of Restoration Plan Tech Memo
14-Dec-2007	Water Operations Model Work Plan Tech Memo
14-Dec-2007	Chinook Salmon Temporal Occurrence and Environmental Requirements Technical Tables Tech Memo
07-Dec-2007	Water Operations Existing and Future Without Project Conditions Tech Memo
08-Nov-2007	Regulatory Compliance Strategy, Draft Tech Memo - Nov 2007
08-Oct-2007	Draft Technical Memo - Purpose and Need for Action - October 2007

Documents Center

Welcome to the Documents Center

Here you can find a wide array of Program information: Settlement information, current Program documents, press releases, fact sheets, and other outreach materials.

Note: Some files in this section are very large and may take several minutes to load.

If you have any difficulties viewing documents, please contact Margaret Giddings, mgiddings@pwr.usbr.gov or 916-919-0106.

Stakeholder Coordinating (9)

- Fisheries Management Work Group (9)
- March 11 Technical Feedback Meeting (4)
- May 13, 2008 Technical Feedback Meeting (5)
- July 8, 2008 TIG Mts (2)
- August 12, 2008 TIG Meeting Materials (2)
- September 8, 2008 Tech Feedback Mts Materials (2)
- Water Management Work Group (9)
- February 20 Technical Feedback Meeting (2)

Approach to Defining the Limiting Factors for Adult Migration

Forcing Function	Limiting Factor	Physical Impacts(s)	Biological Response(s)	
Hydrology	Insufficient streamflow	unsuitable water temperature	disease, increased mortality, increased egg mortality <i>in vivo</i>	
		degraded water quality	increased straying, reduced survival and fecundity disrupted migratory cues	
		insufficient depth	increased straying, reduced survival and fecundity disrupted migratory cues	
		altered flow (quantity)	increased straying, reduced survival and fecundity disrupted migratory cues	
	Altered water signature	altered water chemistry	increased straying, reduced survival and fecundity disrupted migratory cues	
Diversion/Barrier	Physical barrier	Degraded water quality	degraded water quality	increased straying, reduced survival and fecundity disrupted migratory cues, disease
		excessive vertical barrier, wall	physical injury, migration barrier	
		insufficient depth	increased straying, reduced survival and fecundity disrupted migratory cues	
		unsuitable velocity	increased straying, reduced survival and fecundity disrupted migratory cues	
Harvest	Excessive harvest	removal and harassment of fish	increased stress, reduced abundance, mortality	
Contaminant Input	Degraded water quality	poor water quality	increased straying, reduced survival and fecundity disrupted migratory cues, disease	
		unsuitable water temperature	disease, increased mortality, increased egg mortality <i>in vivo</i>	

Approach to Defining the Limiting Factors

- Forcing Function
 - The driving force impacting the ecosystem.
- Limiting Factor
 - Stressors resulting from forcing functions that significantly influence the abundance and productivity of the Chinook salmon population.
- Physical Impact(s)
 - The physical impact of the limiting factor.
- Biological Response(s)
 - The biological response of the physical impact.
- Significant:
 - Affect ability to meet Restoration Goal

Limiting Factors Definitions Adult Migration Example

Forcing Function	Limiting Factor	Physical Impact(s)	Biological Response(s)
Hydrology	Insufficient streamflow	unsuitable water temperature	disease, increased mortality, increased egg mortality <i>in vivo</i>
		degraded water quality	increased straying, reduced survival and fecundity disrupted migratory cues
		insufficient depth	increased straying, reduced survival and fecundity disrupted migratory cues
		altered flow (quantity)	increased straying, reduced survival and fecundity disrupted migratory cues
	Altered water signature	altered water chemistry	increased straying, reduced survival and fecundity disrupted migratory cues

- Forcing Function: Hydrology
 - The driving force impacting the ecosystem.
- Limiting Factor: Insufficient streamflow and altered water signature
 - Stressors resulting from forcing functions that significantly influence the abundance and productivity of the Chinook salmon population.
- Physical Impacts: Various
 - The physical impact of the limiting factor.
- Biological Responses: Various
 - The biological response of the physical impact.

Approach to Defining the Limiting Factors for Adult Migration

Forcing Function	Limiting Factor	Physical Impact(s)	Biological Response(s)
Hydrology	Insufficient streamflow	unsuitable water temperature	disease, increased mortality, increased egg mortality <i>in vivo</i>
		degraded water quality	increased straying, reduced survival and fecundity disrupted migratory cues
		insufficient depth	increased straying, reduced survival and fecundity disrupted migratory cues
		altered flow (quantity)	increased straying, reduced survival and fecundity disrupted migratory cues
	Altered water signature	altered water chemistry	increased straying, reduced survival and fecundity disrupted migratory cues
Diversion/Barrier	De graded water quality	de graded water quality	increased straying, reduced survival and fecundity disrupted migratory cues, disease
	Physical barrier	excessive vertical barrier, wall	physical injury, migration barrier
		insufficient depth	increased straying, reduced survival and fecundity disrupted migratory cues
		unsuitable velocity	increased straying, reduced survival and fecundity disrupted migratory cues
Harvest	Excessive harvest	removal and harrassment of fish	increased stress, reduced abundance, mortality
Contaminant Input	De graded water quality	poor water quality	increased straying, reduced survival and fecundity disrupted migratory cues, disease
		unsuitable water temperature	disease, increased mortality, increased egg mortality <i>in vivo</i>

The Restoration Strategy is the Adaptive Management Strategy

- Fisheries Restoration Strategy = Fisheries Adaptive Management Program
- Guide for future fisheries management actions
- Allows flexibility and adjustment for:
 - Increased knowledge and understanding
 - Changing conditions
- Building on other strategies

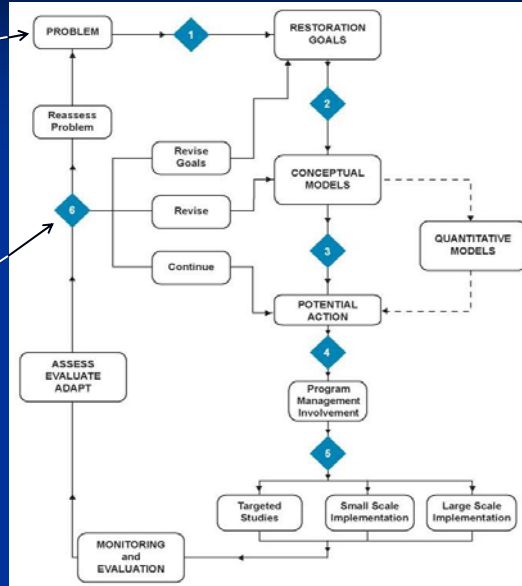

Adaptive Management Process

Start by defining the problem

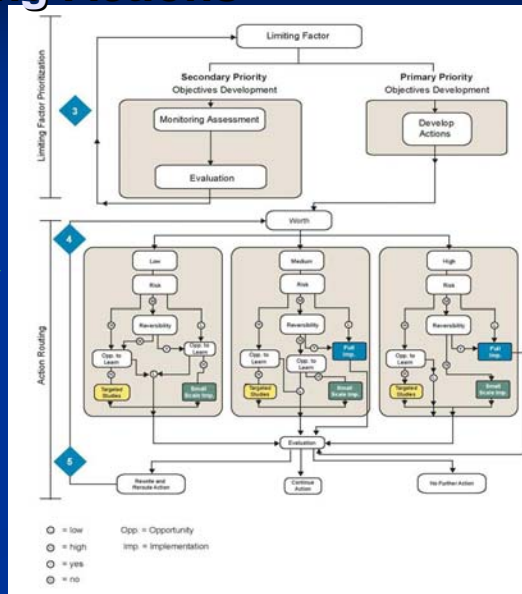

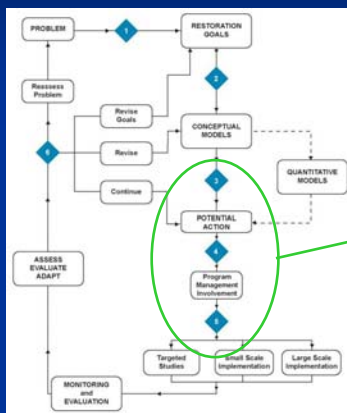

Decision Node = Key or critical decision points

The Adaptive Management Process is the foundation of the FMP.

- Decision Nodes:
1. Identify problem
 2. Develop restoration goal
 3. Limiting factors prioritization
 4. Action routing
 5. Program management input (cost, feasibility, partnering, political considerations, etc.)
 6. Assess and adjust

Limiting Factor Prioritization and Routing Actions

Action Routing Definitions

- **Worth**
 - Measure of a positive outcome.
 - Combines the magnitude and certainty of positive outcomes to convey a “value” of an action.
- **Risk**
 - Measure of the risk of a negative outcome.
 - Combines the magnitude and certainty of negative outcomes to convey the cumulative “potential” for a Restoration Action to result in an adverse, or negative outcome.
- **Reversibility**
 - The ease and predictability with which the outcomes can be undone and/or reversed.

Example Adult Migration Objective and Decision Tree Action Routing

- **Limiting Factor:**
Inadequate Streamflow
- **Objective:** Provide flows sufficient to ensure habitat connectivity and allow for unimpeded upstream passage

Location	Priority
Reach 1	Low – Has flow year-round
Reach 2	High – No flows under existing conditions
Reach 3	Low – Has flow most of the year
Reach 4	High – Limited or no flows under existing conditions
Reach 5	High – Multiple sources of flow that could influence straying

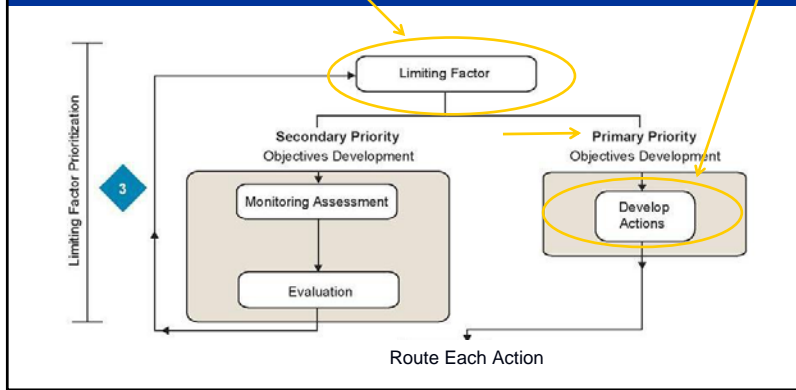

Limiting Factor Prioritization

Limiting Factor: Inadequate Streamflow

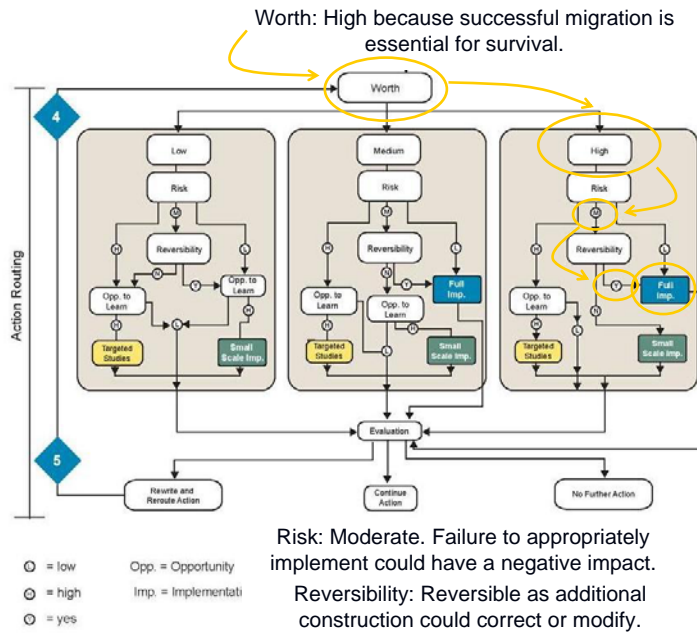

Potential Actions:

- Low flow channel construction
- Channel modifications in Reaches 2 and 4
- Verify adult temperature objectives

Action Routing: Low Flow Channel Construction

Action: Design low flow channels to maintain adequate depth and connectivity for adult passage in all years (including dry years).

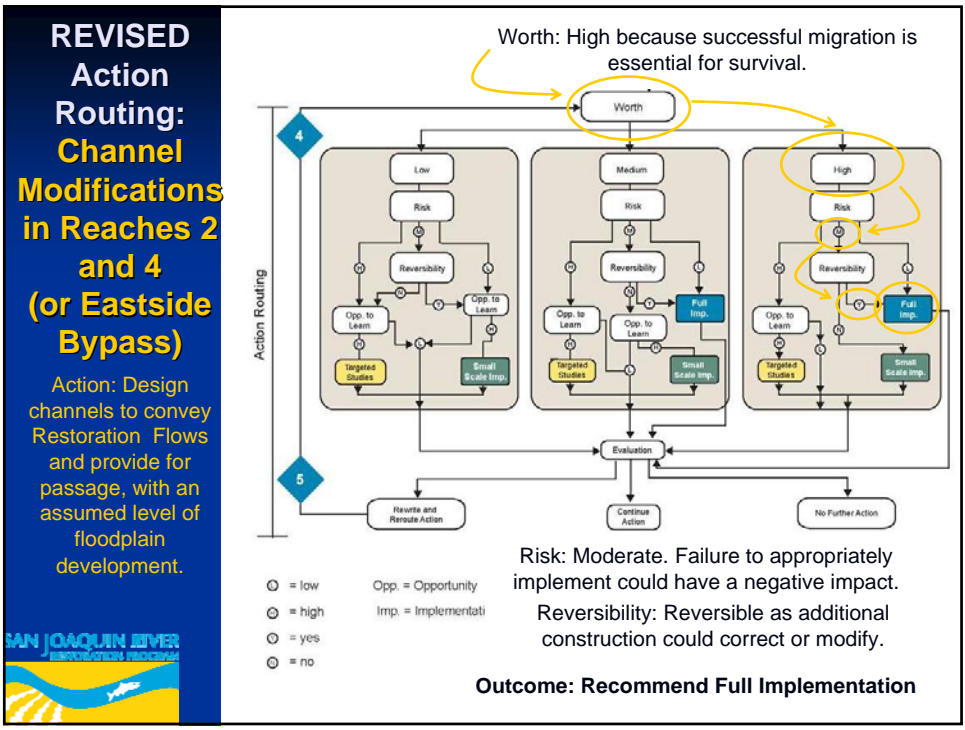

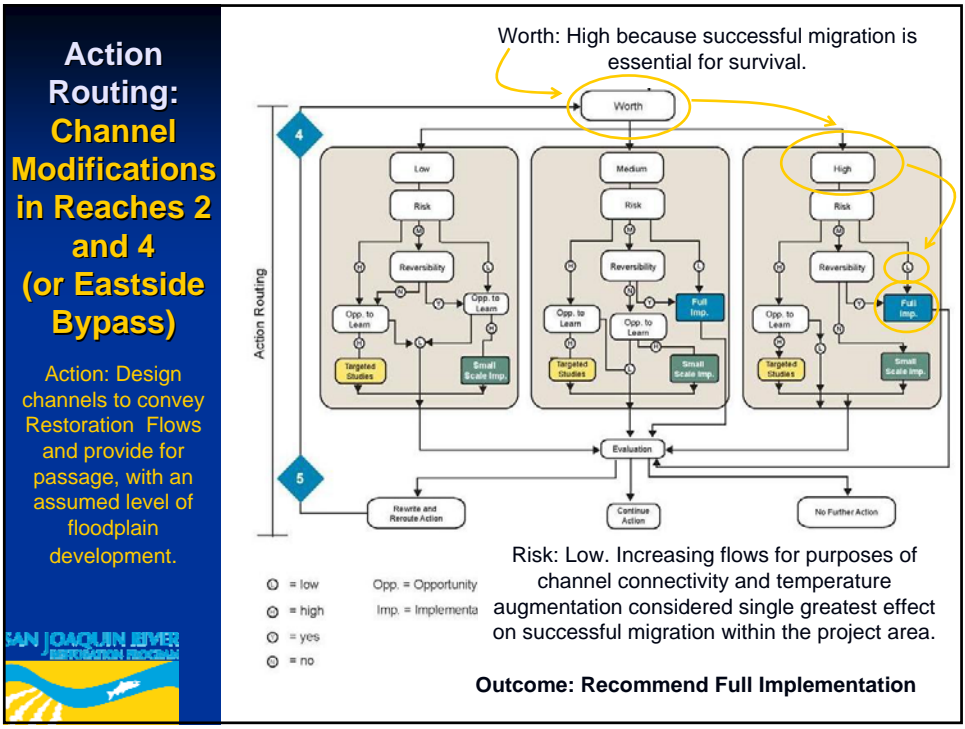

- = low
- = high
- = yes
- = no
- Opp. = Opportunity
- Imp. = Implementation

Risk: Moderate. Failure to appropriately implement could have a negative impact.

Reversibility: Reversible as additional construction could correct or modify.

Outcome: Recommend Full Implementation

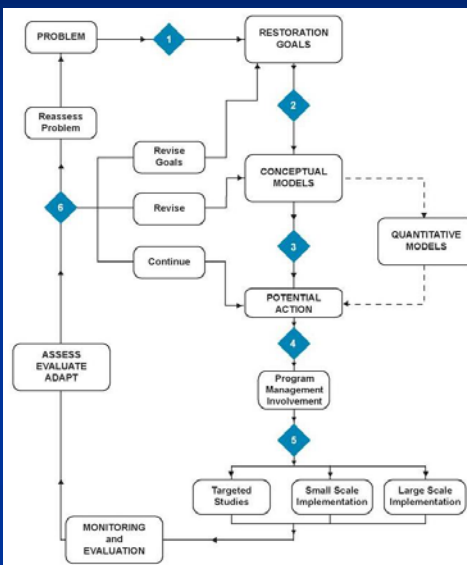

Adaptive Management Process: Questions

- Does the Restoration Strategy Section appear concise and transparent?
- Does it follow a logical process?
- Do the examples work?
- Do you have recommendations for a different process or improvements to the process?

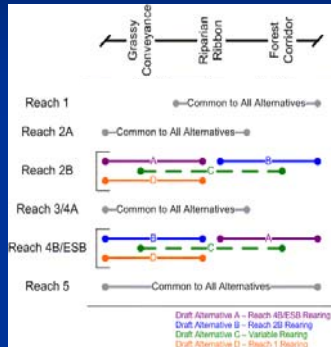

Decision Node 5 – Address Questions and Input?

- Decision Node 5 includes non-biological considerations such as cost, feasibility, partnering and cost sharing, and political considerations
- What additional items should be considered in this node?
- Does this node address the input received at the September meeting?

Future Meeting: Reach-by-Reach Actions Common to all Concepts

- Discussed at September meeting
- Continuing to work on this and anticipate more information at November meeting

Future Meeting: Reintroduction Section

- Information on the section was requested at the September meeting
- Related to Genetics Management and will be addressed at the December meeting

Next Meetings

- November 4
 - Topics:
 - Restoration Strategy and Objectives
 - Interim Flows (Fisheries needs)
- December 10
 - Topics:
 - Genetic Management
 - Any Outstanding Topics
- Meetings at CSU Stanislaus
- 1:00 p.m. to 3:00 p.m.

SAN JOAQUIN RIVER RESTORATION PROGRAM
